

Voicemail Transcription — What We Need From You

A short setup checklist to switch on the service: your voicemails are read from a mailbox, transcribed and summarized with AI, and logged to your Google Sheet — with a link back to the original email so your team can play each recording.

Document · **Service Requirements** · Audience · Your IT / admin contact

Setup time · ~30 minutes

HOW THE SERVICE WORKS

Voicemail arrives in your mailbox → We read it (audio attachment) →
AI transcribes + extracts details → Row added to your Google Sheet →
link opens the original email

WHAT WE NEED FROM YOU

1 Voicemails delivered to a mailbox as audio

REQUIRED

- WHAT** Your phone / voicemail system set to email each voicemail to one mailbox, with the recording attached as an **audio file** (`.wav` or `.mp3`).
- WHY** That email is the source we read. If voicemails don't land in a mailbox as an attachment, there is nothing for the service to transcribe.
- HOW** Confirm "voicemail-to-email" (or "voicemail transcription forwarding") is enabled on your phone system, pointed at the mailbox in step 2. Send us the **sender address** and **subject line** those emails use.

2 Access to that mailbox (email + app password)

REQUIRED

WHAT	The mailbox's full email address and an app password we can use to read it over IMAP (read-only — we never send, move, or delete anything).
GMAIL	Turn on 2-Step Verification , then create an App Password (myaccount.google.com → Security), and make sure IMAP is enabled in Gmail settings. Send us the address + the 16-character app password.
OTHER PROVIDERS	A custom-domain mailbox (e.g. your website host's email / cPanel, or Google Workspace) works too — send the address, password, and IMAP host if you know it.
NOT SUPPORTED	Outlook.com / Microsoft 365. Microsoft has disabled the password-based access method we use, so those mailboxes can't be connected this way.

3 A Google Sheet, shared with our service account

REQUIRED

WHAT	The Sheet ID (the long string in the Sheet's URL: <code>docs.google.com/spreadsheets/d/THIS-PART/edit</code>), and Editor access for our service account so we can write rows to it.
HOW	Open the Sheet → Share → add the service-account email we give you (<code>...@...iam.gserviceaccount.com</code>) as an Editor . Add a tab for the entries — we'll use one named <code>Voicemails</code> unless you tell us otherwise.

4 Sign-in access for whoever will play the recordings

REQUIRED

WHAT

Each Sheet row has an **Open email** link that jumps to the original voicemail so your team can play or download the recording. For privacy, we keep **no copy** of the audio — the link goes back to your mailbox.

WHY IT MATTERS

That link only works for people **signed in to the voicemail mailbox**. So the people who use the Sheet need access to that mailbox (or a shared inbox that receives the voicemails).

TELL US

Which webmail you use — **Gmail, cPanel / Roundcube**, or other — so we build the link correctly.

5 Language & filtering details

RECOMMENDED

LANGUAGE

The language(s) callers usually speak (the AI handles multiple languages; this just helps us tune accuracy).

FILTERING

The sender address / subject your voicemail emails use, so we pick out only voicemails and ignore the rest of the mailbox — faster and cleaner.

6 Permission to process the recordings

REQUIRED

WHAT

Voicemails contain personal information (names, phone numbers, what the caller says). To transcribe them, the audio is sent to **Google's AI (Gemini)** for processing, and the extracted details are written to your Sheet.

WE ASK FOR

Your written go-ahead to process this data on your behalf, and any **retention** preferences (how long entries should live in the Sheet). You can revoke access anytime by removing the app password or un-sharing the Sheet.

7 A technical point of contact

REQUIRED

WHAT One person on your side who can enable IMAP, generate the app password, share the Sheet, and confirm the voicemail-to-email setup — so we can resolve setup questions quickly.

INFORMATION TO SEND US

ITEM	EXAMPLE / FORMAT	NEEDED
Voicemail mailbox address	voicemail@yourcompany.com	• required
App password for that mailbox	abcd efgh ijkl mnop	• required
Email provider / IMAP host	Gmail · Google Workspace · cPanel host	• required
Webmail your team signs into	Gmail · Roundcube · other	• required
Google Sheet ID	1nWQso4Jkc7...k5fQ-1E	• required
Sheet tab name	Voicemails (default)	◦ optional
Voicemail sender address	voicemail@yourphoneprovider.com	◦ recommended
Voicemail subject line	"New voicemail from ..."	◦ recommended
Language(s) expected	English · Korean · ...	◦ recommended
Technical contact	name + email	• required

SETUP CHECKLIST

☐ **Voicemail-to-email is on** and delivers audio attachments to one mailbox.

☐ **Mailbox is reachable** — app password created, IMAP enabled (not Outlook/365).

☐ **Google Sheet shared** with our service-account email as Editor, with a tab ready.

☐ **Listeners have mailbox sign-in**, and you've told us the webmail type.

☐ **Processing approved** and retention preference noted.

☐ **Technical contact named**, and the "Information to send us" fields returned.

WHAT WE STORE — AND DON'T

PRIVACY BY DESIGN

We **do not keep copies** of your voicemail recordings. The audio stays in your mailbox; each Sheet row simply links back to the original email. The recording is sent to Google's AI only to transcribe it, then the transcript and caller details are written to your Sheet.

You remain in control: remove the app password or un-share the Sheet at any time and the service stops immediately.

NOTES & LIMITATIONS

- **Outlook / Microsoft 365 mailboxes are not supported** with password access. If your voicemail lands there, we'd need to route it to a supported mailbox (e.g. forward to a Gmail address).
- **Audio formats:** `.wav` and `.mp3` are fully supported; most others work, and a few uncommon formats may need conversion — we'll flag it if so.
- **The "Open email" link** requires the viewer to be signed in to the voicemail mailbox — it isn't a public download link, by design.
- **Credentials** are used read-only and stored securely on our side; rotating the app password rotates our access.
